

## Snowshoe TRAIL ALPI for ice crampons

Weight without crampons: 340g per pair  
Area: 22x40cm

Compact, ultra-light snowshoe for mountaineering and mountain rescue. Compatible with almost all ice crampons, it is fitted between the crampon and the boot without adjustment.

Based on the SnowPlak Approach concept, it has a similar load-bearing capacity, but with less grip when traversing and descending. This clog-like shape cuts through the snow for fast walking. Its suppleness gives a pleasant foot roll with a slight bounce in powder.

Its exceptional weight and affordable price make it an ideal compromise when every gram counts.

Fitting: pass the crampon straps between the Dyneema cords to lock the plate between the boot and the crampon when you lock it.

Precautions for use :

SnowPlak snowshoes are designed to reduce sinking on loose snow but should not be used without crampons or on frozen hard snow slopes or too steep a descent. The two pieces of equipment together form a snowshoe that makes approaching and hiking easier, in the context of the usual use of a snowshoe.

Ice crampons must be used alone when they are essential for safe mountaineering.
